loura

Sense. Decide. Act. Verify.

Loura turns operational reality into *verified action*.

One live model of how the operation runs, and a governed loop that acts on it in real time, on the systems you already have.

The problem

No system holds the organization as one connected thing, so the hardest operational work is done *in people's heads*.

Each system holds its own slice accurately and knows nothing about how that slice relates to the others. So every cross-boundary event needs a person to assemble context, apply policy from memory, chase people across channels, and verify closure by hand.

Inside one plant · our design partner

Food manufacturer, ~200 active SKUs

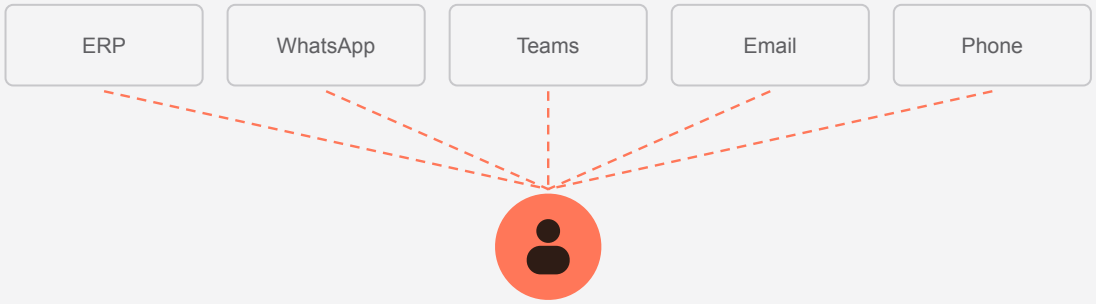

ERP
Microsoft Dynamics Business Central, deliberately simple and progressively extended

Coordination runs on
Business Central + WhatsApp, email, Microsoft Teams and the phone

Already automated
Reordering fires when stock hits a threshold

Still entirely manual
Everything after the PO: supplier follow-up, negotiation, monitoring, documentation, letters of credit, and confirming material arrives usable

Why it stays manual

Every connection between them exists only here.

Because the links are not in software, context cannot be assembled by software. The logic applied is whatever that person knows; the action taken is whatever they can chase. Nothing accumulates: the same event is solved from scratch each time, and the capability leaves when they do.

The problem, continued

Every existing option solves a piece of it. *None carries the loop.*

This is not an underserved market because nobody tried. It is underserved because the work that breaks sits precisely between the tools.

ERP · MES · SCADA

Authoritative inside their own domain. They hold records; they do not carry cross-boundary work.

BI and dashboards

Show you a number. Someone still has to assemble the situation, decide, and chase.

RPA and workflow tools

Hold only while conditions don't change. They break on the exception, which is the actual work.

Consultancies and SIs

Produce a recommendation or a bespoke build. Nothing compounds into software.

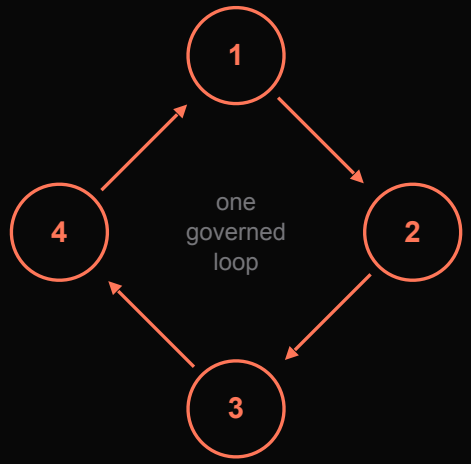

Hiring more capable people

Works, and does not scale. It also keeps the capability inside individuals.

loura

The solution

Agents take bounded responsibility. People keep the decisions, with authority, evidence and *verified closure* enforced in software.

1 **Sense** — Read the systems in real time. Open a case the instant reality moves out of spec.

2 **Decide** — Assemble the situation, then apply the organization's own policies, priorities and prior decisions.

3 **Act** — Assign, ask, remind, escalate, update a system, or execute a permitted action, within granted authority.

4 **Verify** — Confirm through evidence that it happened and the intended state was reached. Feed that forward.

Three distinctions that make it usable in a plant

Authority is enforced, not described

Permitted actions proceed. Approval-required actions wait. Prohibited actions do not run. Authority is re-checked before dispatch, and agents cannot expand their own authority.

“Unknown” is a first-class state

Missing, stale and conflicting data are shown and reduce confidence. The system never converts missing data into confidence.

Resolved is not verified

Only evidence, or an explicit authorized waiver, closes an outcome. Silence is never approval.

loura

Product

One platform, five capability areas, and a prototype that already runs three end-to-end journeys, including *the reuse test*.

The platform

Administration — access · authority · attributable history

1	**Work Hub**	People and teams: start work, review, approve, intervene
2	**Coordination & execution**	Runs, waits, checkpoints, bounded recovery
3	**Studio**	Reusable agents and procedures, versioned and published
4	**Knowledge & connections**	Sources, events and permitted actions

Running today · internal prototype

Three journeys, end to end

1 **Investigate and create**

Ask against selected sources; the agent drafts an editable comparison; share it. Someone outside the audience gets “You can't open this.”

Revise mid-edit: the agent's result is kept beside yours, never over it.

2 **Pursue a shared outcome**

A Mission with three tasks and a real dependency. One runs while the dependent one waits; a colleague answers a focused request with evidence.

A reviewer requests changes; revise; new version; accept.

3 **Continue and respond to change**

The agent watches a delivery. The date moves, it reassesses and asks for approval. Pause holds actions but keeps observing.

Lose the response and the outcome is uncertain, not done.

The reuse check A second activity ran on the same platform. No code and no screen differs.

loura

Why now

Models can finally carry work over time, Saudi industry is *actively funded* to digitize, and no incumbent holds the organization as one thing.

11,672

Operating and under-construction factories in Saudi Arabia

4,000

Factories targeted by the Ministry's Future Factories programme

80%

Of project value covered by industrial digitization grants, capped at SAR 300,000

The technology crossed a threshold

Models can now perceive context, reason over an evolving situation, use tools and act over time, rather than waiting for a human to operate each step. The constraint moved from “can a model reason about this” to “can it be given bounded authority, real connections and verified closure.” That is a systems and product problem, which is where we build.

The category is opening, not closed

Palantir proved enterprises need an operational layer over fragmented systems, and proved how hard it is to build. Industrial agent companies are appearing, which validates the direction. None is native to the Gulf. The window is the gap between “AI is obviously coming to operations” and “someone owns that layer regionally.”

Source: Ministry of Industry and Mineral Resources. These programmes create budget and political permission. They do not prove demand for Loura.

loura

Traction

We are pre-revenue. The evidence is in the pipeline: 962 accounts sourced, 23 live today, and *six at NDA or beyond.*

962
Accounts sourced
98% food manufacturing

→

252
Worked
26% of sourced

→

6
At NDA or beyond
26% of live

→

1
Design partner
Won, and unpaid

SAR 375K to 600K

Annual pricing quoted to the two accounts furthest along. Independent support for the US$130K to 150K offer.

US$600,000

Contract value logged across the four accounts with a value recorded, averaging US$150,000 each.

79

Accounts disqualified on ICP fit before we spent delivery time on them. The screen is doing its job.

loura

Market

Start with Saudi food manufacturing: narrow enough to win, structurally identical enough to *repeat*.

Across all 16 food categories a plant runs the same end-to-end structure: about 14 coordinated steps and 7 inter-function checks. HACCP is mandatory regardless of size and SFDA inspects continuously, so batch records, CCP logs and traceability already exist every shift.

The layered opportunity

Beachhead	Saudi food & beverage manufacturers with an ERP and real operational complexity	Bottom-up count to confirm
Expansion 1	Saudi manufacturing	11,672 factories · 4,000 targeted
Expansion 2	Saudi government: DGA Whole of Government unifies sectors without replacing core systems	Same problem, national scale
Expansion 3	Defence and broader enterprise, GCC	GAMI: >50% of military spend localized by 2030

Room to expand inside one account

1 **More use cases**

Material readiness, then demand planning, then supplier follow-through. Each a separate recurring line.

2 **More sites**

A multi-plant group is one connected model, many deployments.

3 **Deeper autonomy**

Level 3 checkpointed work becomes Level 4 autonomous as evidence accumulates.

loura

Business model

Recurring platform revenue per use case, priced so that implementation *never becomes the business.*

US$130–150K

Per defined use case, per year, recurring. The current offer under discussion, not signed revenue and not validated pricing.

Who pays

CEOs, owners and operations leaders. In founder-led and family-owned Saudi manufacturing groups the economic buyer and the operational sponsor are frequently the same person, which shortens the sale and makes executive sponsorship obtainable.

The journey

Consultation and discovery → prototype → customer decides → development and deployment on agreed terms, with payment expected before full delivery.

Charging model

Recurring baseline

US$130–150K / year per use case

→ Continue

FDE & consultation

Currently waived, deliberately

→ Begin charging

Outcome-based

No established component

→ Introduce with agreed measures

The three curves we manage

Time to a live loop falls · reusable share rises · account revenue expands. Target on deployment two: live loop in under 66% of deployment one, bespoke under 10% of accepted requirements, and no founder involvement in the build.

How we stay a product company

A design, not an intention

A productization gate

Every requirement classified weekly by a named decision-maker. Default on bespoke is no.

Bespoke carries an expiry date

By then it is promoted to core, replaced by configuration, or removed.

Field is not paid on deployment revenue

Paying for services volume is how a product company becomes an agency.

Implementation priced at or near cost

If implementation carries margin, we will optimize for more of it.

No per-customer screens

Custom UI is the quietest form of bespoke: individually cheap, collectively fatal.

FDE rotation is structural

If only the person who built it can serve the customer, it was never productized.

loura

Go-to-market

Forward-deployed engineering: go inside the operation, because the context and logic we need *aren't written down anywhere.*

The engagement sequence

1 Gate

Named executive sponsor, one metric with a numeric baseline, dated data-access commitments, a review cadence. No gate, no engagement.

2 Discover

Observe the real process, not the documented one. Users, systems, consequences.

3 Lock

One controllable operational lever. Not a platform rollout.

4 Build

Nothing is complete without repeatable evaluation.

5 Prove

Compare against the customer's own baseline on live data.

6 Deploy

Release only when the evidence passes. Humans keep final say on consequential actions.

7 Productize

Every engagement must yield reusable capability: a connector, an ontology pattern, an agent template, an evaluation set.

Our design partner is here

Reach

Founder and investor networks reaching owners and operational leaders who can sponsor a deployment. Saudi company, Saudi founders, Arabic capability, and a qualified target list built to a defined SOP.

Win

Sell one occurrence, quantified: the cost of manual stitching in a specific operation, not “an AI platform.” Qualify on reusability, not only pain and budget.

Expand

Sector density before breadth: the second customer should be another food manufacturer. Then second use case, second site, deeper autonomy. Then sector playbooks and references.

loura

Competition and advantage

The alternatives are real and well funded. Our bet is authority, verified closure, and *reuse that compounds*.

Alternative	What they are	Where the gap is for our customer
Palantir	Foundry Ontology + AIP, the reference architecture for modelling the operational world across fragmented data, logic and actions.	Proves the value and the difficulty. Priced, scoped and staffed for a different customer than a Saudi mid-market food group.
Industrial agent companies	Agentic factory operating software; specialized production agents acting on industrial problems.	Validates the direction. Built around the production process, not the organization's authority structure. Not Gulf-native.
Industrial AI suites	Plant insights, workflow intelligence, digital twins, predictive asset intelligence, factory agents.	Strong analytics and asset depth. The cross-boundary work of chasing, approving and verifying stays human.
Consultancies and SIs	Discovery, recommendation, bespoke build.	Nothing compounds into software. The customer pays again next time.
Internal enterprise AI teams	Build it themselves.	Real, and the most common competitor. Constrained by talent, by integration and security burden, and by this not being their product.
Do nothing	Keep stitching manually.	The honest default, and the one we most often beat on measured cost of coordination.

The team

Enterprise product, forward deployment at Palantir, and a company that already *pivoted once, decisively,* with the capital intact.

loura

Where we are, and where this goes

Bottom-up: one workflow, one measured result, then reuse. Top-down: the layer that holds an organization together as *one connected thing*.

The proof path, in order and without skipping

1
Lock the use case
The problem is real and measurable

2
Complete data access
It is buildable

3
Win against the baseline
It works

4
Reach controlled production
They will use it

5
Convert to a paid engagement
They will pay for an outcome

6
Demonstrate economic value
It is worth what we charge

7
Repeat on a second activity
It is a product

8
Measure productization
The engine works

9
Establish recurring revenue
It is a business

10
Only then broaden
Earned, not narrated

loura

Sense. Decide. Act. *Verify*.

One live model of how the operation runs, and a governed loop that acts on it in real time, on the systems you already have.
